INSTALLATION IN PIT

CHARACTERISTICS

Extremely robust platform that allows it to be used on the ground or embedded into a pit using its rim pit (next page). Due to its characteristics, its assembly is fast and its leveling by the ground efficient. It is possible to fit the platform into a pit only 8 cm deep.

Manufactured in two versions: painted steel or completely in stainless steel, it is equipped with 4 cells in nickel-plated steel in the painted versions and in stainless steel in the INOX version.

Each cell supports in the ground or in the rim (depending on the installation), by a pivoting foot, in Steel or Stainless Steel, with a kneecap system that assures a return to the initial position against all the lateral efforts.

The cell connection is carried out in an aluminum mixing box, which complies with IP66, from which the connection cable for the display goes out.

FINISH

- Painted with zinc epoxy primer and polyurethane enamel in thye structure and rim, and textured on cover cap.
- Fully AISI 304 Stainless Steel plate with glass jet finish.
